GNANI AI · GREAT INDIAN AI INTERNSHIP CHALLENGE 2026

THUNAI 1913

A Tanglish voice call-taker and live triage board for Chennai's flood helpline. When the lines are full, Thunai answers.

THE PROBLEM

On a normal day Chennai's 1913 helpline takes about 2,000 calls. During Cyclone Michaung it logged **7,129 complaints in two days** and residents reported an overloaded hotline. Cyclone Murasu hit on 1–2 Nov 2026 and another system may follow. The calls that matter most are the hardest to handle: a frightened caller in waist-deep water, speaking Tamil, Tanglish, English, Hindi or Telugu over rain, must name an area like Pallikaranai clearly enough to be found.

THE SOLUTION

Thunai answers overflow calls, turns speech into a **structured ticket** (area, landmark, water level, people, vulnerable members, hazards, needs), **reads the area back for confirmation**, closes with a ticket number and safety advice in the caller's language, and places the ticket on a live map that Corporation staff work from. Overnight WhatsApp voice notes are triaged in one batch job. **Model proposes, code decides:** every spoken line is a reviewed script and priority (P1/P2/P3) comes from 17 plain rules, listed on each ticket.

HOW WE USE GNANI AI

- **Prisma v3.0 (REST STT)** on every caller turn: four candidate languages, codemix output, 175 Chennai keyterms, topic and previous_text.
- **Prisma v3.0 Batch** for overnight voice notes: `with_denoise`, keyterms, per-segment language. 20 files ranked in 25 s end to end.
- **Timbre v3.0 (TTS)** for every reply and spoken status update, in the language Prisma detected; **µ-law 8 kHz** output to test on a real telephone codec.
- **Evon v3.3**-ready: an optional LLM endpoint can fill missed fields, but never sets priority.

MEASURED RESULTS (NOISE LAB)

71%	100%	~200 ms	25 s
area correct without keyterms (cyclone, 5 dB)	area correct with keyterms, clean, 10 dB and 5 dB	median Prisma time per clip	20 voice notes to ranked tickets

12 synthetic lines × 2 voices per condition, µ-law 8 kHz with rain and traffic noise. Synthetic voices are cleaner than real callers, so treat these as upper bounds from a small set.

IMPACT

- Overflow callers get answered instead of redialling
- Bedridden, pregnant and infant cases surface first
- Officers see which rules fired and can override
- Ranked CSV export for field teams

HONEST LIMITS AND NEXT STEPS

- Demo uses synthetic data only; not connected to any emergency service
- Next: SIP/Exotel trunk, GCC ward data, street-level geocoding
- Human supervision on every P1; native-speaker review of Hindi and Telugu
